Estimating cases for COVID-19 in South Africa
Update: 19 May 2020

Sheetal Silal1, Juliet Pulliam2, Gesine Meyer-Rath3,4, Brooke Nichols3,4, Lise Jamieson3, Zaid Kimmie5, & Harry Moultrie5
on behalf of the South African COVID-19 Modelling Consortium

1 Modelling and Simulation Hub, Africa (MASHA), University of Cape Town, South Africa
2 South African DSI-NRF Centre of Excellence in Epidemiological Modelling and Analysis (SACEMA), University of Stellenbosch, South Africa
3 Health Economics and Epidemiology Research Office (HE2RO), University of the Witwatersrand, Johannesburg, South Africa
4 Boston University School of Public Health, US
5 National Institute for Communicable Diseases (NICD), South Africa
Introduction

- South African COVID-19 Modelling Consortium

- Uncertainty regarding both the true scale and spatial distribution as a result of PUI criteria and testing coverage

- Models developed by MASHA, SACEMA and HE2RO in conjunction with the NICD

- Extensive and ongoing input from clinicians, virologists, intensivists and epidemiologists to refine key model assumptions and parameters

- Projections will be updated weekly
Projections in Context

- Projections at a population level do not capture clustering of cases
  - E.g. Sharp increases in cases in the Eastern Cape
  - A spatial model with additional granularity is required (forthcoming)

- Models project total need for hospital beds and ICU beds
  - Do not account for stricter criteria to entry and existing capacity

- Population behaviour/response to mortality
  - Lessons from Ebola epidemic (adaptive behaviour to decrease mortality)

- Projections will improve with new data
  - Hospitalisation (public and private)
  - Length of stay

- Short term vs Long term Projections
Users of model outputs
National COVID Models

• National COVID-19 Epi Model
  • Generalised SEIR model
  • Disease severity (asymptomatic, mild, severe, critical)
  • Treatment pathway (outpatients, non-ICU, ICU)

• National COVID-19 Cost Model
  • Inputs from a range of resources to represent the type, number and price of ingredients to cost response
  • Inform resource requirements and predict where gaps may arise based on available resources

1. Force of infection
2. Latent period till asymptomatic infectiousness
3. Duration of asymptomatic infectiousness
4. Latent period till pre-symptomatic infectiousness
5. Mild cases
6. Duration of infectiousness (mild cases)
7. Severe cases
8. Hospitalisation of severe cases
9. Hospitalisation of critical cases (prior to ICU)
10. Mortality (severe, hospitalised cases)
11. Duration of hospitalisation (severe cases)
12. Progress from severe to critical (ICU admission)
13. Progress from severe to critical (ICU admission)
14. Duration of ICU stay for survivors
15. Duration of hospitalisation post-ICU
16. Mortality (critical, ICU cases)
Two scenarios

Assumption: Level 4 continues until 31 May followed by social distancing measures

Optimistic scenario
• Lockdown reduced transmissibility by 60%
• Level 4 from 1 May to 31 May: 35%
• Social distancing measures after 31 May reduces transmissibility by 20%

Pessimistic scenario
• Lockdown reduced transmissibility by 40%
• Level 4 from 1 May to 31 May: 25%
• Social distancing measures after 31 May reduces transmissibility by 10%
Short-term projections

Detected Cases: 30,433 (18,710, 54,540)

ICU bed threshold (~3,300 beds)
Long-term projections
Long-term projections: Impact of lock-down

• Greater uncertainty

• Lockdown has flattened the curve and pushed the peak later

Key Assumption: Asymptomatic proportion of cases: 75%
Long term projections: National

Current trajectory of detected cases: Optimistic
Provincial Projections
Eastern Cape

Current trajectory of detected cases: Pessimistic

Free State

Current trajectory of detected cases: Better than optimistic
Current trajectory of **detected** cases: Optimistic

**Gauteng**

**Kwa-Zulu Natal**
Current trajectory of detected cases: Optimistic
Western Cape

Current trajectory of detected cases: Pessimistic
Conclusions

• The initial social distancing and lockdown measures have worked:
  • Epidemic curve has flattened and peak been delayed
  • Extension of lockdown to 5 weeks bought us critical additional time to ramp up community testing and prepare mitigation measures for the oncoming wave

• Peak in active cases likely between early July (pessimistic) and early Aug (optimistic). This will be affected by post-lockdown measures.

• Considerable variation in timing and scale of peaks between Provinces. Variation will be greater between districts and sub-districts.

• Under almost all scenarios hospital and ICU capacity will be exceeded though timing and extent is uncertain. Requires a flexible approach to resource acquisition with initial purchases now and additional orders as more information becomes available
### Disease severity with age-specific adjustment for South Africa

<table>

Of those with symptomatic infection:

- ~96% Mild
- ~2.8% Severe
- ~1.2% Critical
