

# COVID-19 TESTING SUMMARY

NATIONAL INSTITUTE FOR  
COMMUNICABLE DISEASES

Division of the National Health Laboratory Service

SOUTH AFRICA WEEK 4 2021

## OVERVIEW OF REPORT

This report summarises national laboratory testing for SARS-CoV-2, the virus causing COVID-19, in South Africa. This report is based on data for specimens reported up to 30 January 2021 (Week 4 of 2021).

## HIGHLIGHTS

- In the period 1 March 2020 through 30 January 2021, 8,234,743 laboratory tests for SARS-CoV-2 have been performed nationally.
- The number of tests performed in week 4 of 2021 (n=230,376) was lower than performed in the previous few weeks.
- KwaZulu-Natal (513 per 100,000 persons), Gauteng (476 per 100,000 persons), Northern Cape (467 per 100,000 persons) and Western Cape (452 per 100,000 persons) provinces had the highest testing rates in week 4 of 2021.
- In week 4 of 2021 the percentage testing positive was 14.0%, lower than has been observed in the previous few weeks.
- Percentage testing positive in week 4 of 2021 was highest in Limpopo (25.6%) and Mpumalanga (20.9%) provinces. Percentage testing positive was 10%-20% in the Western Cape, Northern Cape, KwaZulu-Natal, North West, Free State and Gauteng, and was <10% in the Eastern Cape.
- In week 4 of 2021, compared to the previous week, the percentage testing positive decreased in all provinces.
- Mean laboratory turnaround time in week 4 of 2021 was 2.0 days; 3.2 days in the public sector and <1 day in the private sector.
- Integration of antigen test data from the different settings where these tests are being used into the national database is ongoing, leading to some underestimation of testing volumes.

# COVID-19 TESTING SUMMARY

SOUTH AFRICA | WEEK 4 2021

## Methods

Testing for SARS-CoV-2 began on 28 January 2020 at the NICD and after the first case was confirmed on 5th March 2020, testing was expanded to a larger network of private and NHLS laboratories. Laboratory testing was conducted for people meeting the case definition for persons under investigation (PUI). This definition was updated several times over the reporting period but at different times included (i) symptomatic individuals seeking testing, (ii) hospitalised individuals for whom testing was done, (iii) individuals in high-risk occupations, (iv) individuals in outbreak settings, and (v) individuals identified through community screening and testing (CST) programmes which were implemented in April 2020 and was discontinued from the week beginning 17th May. CST was implemented differently in different provinces, and ranged from mass screening approaches (including asymptomatic individuals) to screening of individuals in contact with a confirmed case to targeted testing of clusters of cases. Respiratory specimens were submitted to testing laboratories. Testing was performed using reverse transcriptase real-time PCR, which detects SARS-CoV-2 viral genetic material. Laboratories used any one of several in-house and commercial PCR assays to test for the presence of SARS-CoV-2 RNA. Testing for SARS-CoV-2 using rapid antigen-based tests was implemented towards the end of October 2020. Results of reported rapid antigen-based tests are included in this report, however data are incomplete and efforts are ongoing to improve data completeness.

Test results were automatically fed into a data warehouse after result authorisation. We excluded specimens collected outside South Africa and duplicate entries of the same test for an individual. From week 48 of 2020 onwards, test data were reported from the Notifiable Medical Conditions Surveillance System (NMCSS). Date of specimen receipt in the laboratory was used when date of specimen collection was missing. Proportion testing positive (PTP) was calculated as the number of positive tests/total number of tests and presented as percentage by multiplying with 100. We used 2020 mid-year population estimates from Statistics South

Africa to calculate the testing rate, expressed as tests per 100,000 persons. Patient admission status for public and private sector tests was determined based on the reported patient facility. Laboratory turnaround times were calculated for PCR-based tests and were calculated as the mean number of days between specimen collection and reporting of the result. Categorical variables were compared using the chi-squared test, and continuous variables with the students t-test, with a P-value < 0.05 considered statistically significant.

Health district and sub-district (in the metros) level results were mapped based on geo-locatable public and private sector testing facilities. Estimates of overall prevalence were derived using regression techniques. Estimates were adjusted to produce district-specific positive test prevalences based on the national average age and sex profile of testing for that week. This adjustment allows more accurate comparison of the proportion testing positive across districts.

The report includes tests conducted between 1 March 2020 (week 10 of 2020), the week when the first case of COVID-19 was confirmed, and 30 January 2021 (week 4 of 2021).

## Testing volumes and proportion testing positive

From 1 March 2020 through 30 January 2021, 8,234,743 laboratory tests (PCR and antigen tests) for SARS-CoV-2 were performed. The number of tests performed increased weekly from week 10 of 2020, with the highest number of tests performed during the first wave occurring in week 28 of 2020 (n=307,900), and subsequently decreased. Weekly testing volumes increased again from week 47 (beginning 15 November 2020), with the highest weekly number of tests performed since the start of the pandemic performed in week 1 of 2021 (n=492,346). In week 4 of 2021, 230,376 tests were performed, lower than the previous few weeks. All tests for samples collected in the previous week may not yet be reflected. Reduced testing volumes were observed over weekends and public holidays (Figure 1).

# COVID-19 TESTING SUMMARY

SOUTH AFRICA

WEEK 4 2021

**Figure 1.** Number laboratory tests conducted by date of specimen collection, South Africa, 1 March 2020 – 30 January 2021. Blue dotted line shows the 7-day moving average of the number of tests conducted. Grey bars highlight weekend days and public holidays.

The overall percentage testing positive from week 10 of 2020 through week 4 of 2021 was 18.6% (Table 1). During the first wave of infections, the percentage testing positive increased week on week from week 18 to a peak of 29.7% in week 29 of 2020, and subsequently decreased to 8.4% in week 44 of 2020. During the second wave of infections the percentage testing positive started increasing from week 46 of 2020, to a peak of 34.9% in week 53 of 2020. The percentage testing positive in week 4 of 2021 was 14.0%, lower than has been observed in the previous few weeks (Figure 2).

# COVID-19 TESTING SUMMARY

SOUTH AFRICA

WEEK 4 2021

**Figure 2.** Percentage of laboratory tests positive for SARS-CoV-2 by date of specimen collection, South Africa, 1 March 2020 – 30 January 2021. Blue dotted line shows the 7-day moving average of the percentage testing positive. Grey bars highlight weekend days and public holidays.

## Testing in private and public sectors

From 1 March 2020 through 30 January 2021, 3,570,171 laboratory tests were conducted in public sector laboratories, with 19.3% testing positive. Over this same period, private sector laboratories conducted 4,664,572 tests, with 18.1% testing positive (Table 2). Overall the public sector has conducted 43.4% of tests and accounted for 45.0% of positive tests. In the first wave of infections the peak percentage testing positive was observed in week 30 of 2020 in the public sector (28.8%), and in week 29 of 2020 in the private sector (30.6%). In the second wave of infections the highest percentage testing positive was observed in week 53 of 2020 in both the public sector (35.5%) and private sector (34.4%). From week 3 to week 4 of 2021, the percentage testing positive

decreased by 5.7% in the public sector (20.8% to 15.1%,  $P < 0.001$ ), and decreased by 5.0% (18.0% to 13.0%,  $P < 0.001$ ) in the private sector. In week 4 of 2021 the percentage testing positive was higher in the public sector (15.1%) compared to the private sector (13.0%) ( $P < 0.001$ ).

The mean turnaround time for PCR tests conducted in week 4 of 2021 was 2.0 days. Turnaround time decreased slightly in the public sector (3.2 days) and remained consistent in the private sector (0.8 days) (Figure 3). Turnaround times for public sector tests were highest in KwaZulu-Natal (5.2 days), Mpumalanga (5.0 days), North West (4.1 days) and Limpopo (3.6 days) provinces in week 4 (Figure 4). Fourteen of the 28 (50%) NHLS laboratories performing PCR testing for SARS-CoV-2 had turnaround times  $\leq 2$  days (Figure 5).

## Testing by province

Gauteng (32.0%) performed the largest number of tests in week 4 of 2021, followed by KwaZulu-Natal (25.7%) and Western Cape (13.7%) provinces (Table 3). KwaZulu-Natal (513 per 100,000 persons), Gauteng (476 per 100,000 persons), Northern Cape (467 per 100,000 persons) and Western Cape (452 per 100,000 persons) provinces had the highest testing rates in week 4 of 2021 (Figure 6). Testing rates have decreased in all provinces over the past few weeks.

The percentage testing positive in week 4 of 2021 was highest in Limpopo (25.6%) and Mpumalanga (20.9%). Percentage testing positive was 10-20% in the Western Cape, Northern Cape, KwaZulu-Natal, North West, Free State and Gauteng, and was <10% in the Eastern Cape in week 4 of 2021 (Figure 7 and Table 3). Compared to the previous week, the percentage testing positive decreased in week 4 in all provinces ( $P \leq 0.001$ ). The percentage testing positive was higher than the national average, not weighted for population size, in the Northern Cape, Free State, KwaZulu-Natal, North West, Mpumalanga and Limpopo (Figure 7).

<sup>a</sup> 2020 Mid-year population Statistics SA

<sup>b</sup> Current week compared to previous week

**Figure 7.** Weekly percentage testing positive, by province, South Africa, 10 – 30 January 2021. The horizontal blue line shows the national mean for week 4, beginning 24 January 2021.

## Testing in the public sector

In the public sector, the percentage testing positive decreased in the past week (20.8% in week 3 to 15.1% in week 4 of 2021,  $P < 0.001$ ) (Table 4). The percentage testing positive in week 4 of 2021 was highest in

Limpopo (31.2%) and Mpumalanga (21.7%). The percentage testing positive in the public sector remains higher than the national average, not weighted for population size, in the Western Cape, Northern Cape, Free State, North West, Mpumalanga and Limpopo provinces (Figure 8).

# COVID-19 TESTING SUMMARY

**Figure 8.** Weekly percentage testing positive in the public sector, by province, South Africa, 10 – 30 January 2021. The horizontal blue line shows the national mean for week 4 of 2021, beginning 24 January 2021.

## Facilities with high proportions testing positive

Table 5.1 shows the 25 public sector clinics, hospitals and testing laboratories (where specimens were not tied to a particular facility), that had 25 or more

specimens tested and at least five positive results in the week of 24-30 January 2021, with the highest proportion testing positive nationally. This week's list is dominated by facilities in Limpopo (9) and KwaZulu-Natal (8).

# COVID-19 TESTING SUMMARY

SOUTH AFRICA | WEEK 4 2021

**Table 5.1** Public sector healthcare facilities with a high proportion testing positive, 24-30 January 2021

Facility Name	Province	Tests	PTP (95% CI)
Facility 1	Limpopo	27	0.667 (0.489;0.844)
Facility 2	Limpopo	40	0.625 (0.475;0.775)

## Health district-level results

The data from geo-locatable public testing (almost every public sector facility in the country) and private testing (approximately 83% of private testing facilities) in the week from 24-30 January 2021 have been located within the spatial framework of the health districts and health sub-districts (in the metros). The results, for the 25 municipalities and metropolitan health sub-districts showing the greatest proportions testing positive (PTP) are shown in Table 6. Districts showing the greatest proportions testing positive are concentrated in KwaZulu-Natal (7 districts), the Western Cape and Limpopo (5 districts each).

No districts showed an adjusted proportion testing positive greater than 50% this week, and only two exceeded 40%. The proportion of tests returned positive fell significantly in three districts (2 in KwaZulu-Natal, and one in Limpopo).

# COVID-19 TESTING SUMMARY

SOUTH AFRICA | WEEK 4 2021

**Table 6.** Health sub-districts with the highest proportion testing positive based on public and private sector data for the week of 24-30 January 2021

Health district or sub-district	Province	PTP (95% CI)	Previous week
Ezingoleni	KwaZulu-Natal	0.465 (0.384-0.546)	0.545 (0.467-0.624)

**Figure 19.** Proportion testing positive by health sub-district in Limpopo Province for the week of 24-30 January 2021. Areas shaded white represent districts in which either (i) no tests were conducted, (ii) all tests were negative, or (iii) the confidence interval exceeded 30%.

# COVID-19 TESTING SUMMARY

SOUTH AFRICA | WEEK 4 2021

## Testing by patient admission status

In week 4 of 2021, 30.2% of tests were performed for hospitalised patients; 39.0% in the public sector and 23.6% in the private sector (Figure 20). The percentage testing positive decreased among both

inpatients and outpatients in the past week, and in week 4 was similar among outpatients (14.6%) and inpatients (15.3%) (Figure 21). In week 4 of 2021 the mean laboratory turnaround time in the public sector continued to be lower for inpatients (3.4 days) compared to outpatients (3.7 days) (Figure 22).

**Figure 22.** Mean number of days between date of specimen collection and date of test result in the public sector by patient admission status, 3 – 30 January 2021

## Testing by age and sex

The mean age of individuals tested in week 4 of 2021 was 40.1 years, and was similar among females (40.2 years) and males (40.1 years). As in the previous few weeks, the majority of tests were performed in individuals in the 25-44 years' age groups (Figure 23).

In week 4, the testing rate in males was 355 per 100,000 persons and in females was 399 per 100,000 persons (Figure 24). The highest testing rates were observed in individuals  $\geq 80$  years of age (761 per 100,000 persons) in week 4. The percentage testing positive increased with increasing age, with a peak in the 10-14 year age group, and was higher in females compared to males (Figure 24).

## Testing by test type

Testing for SARS-CoV-2 using rapid antigen tests was initiated towards the end of October 2020. Up to the end of week 4 of 2021, 306,455 antigen tests had been performed (38,430 in week 4). The percentage of antigen tests of all tests conducted has increased over recent weeks from 0.1% in week 44 of 2020 to 16.6% in week 4 of 2021. The majority of antigen tests have been performed in KwaZulu-Natal (n=143,907, 47.0%) and Eastern Cape (n=53,601, 17.5%) provinces

(Figure 25). Over recent weeks the percentage testing positive was higher for PCR tests compared to antigen tests, likely due to the lower sensitivity of antigen tests and the setting in which they were used (Figure 26). Not all antigen tests are included in this report, efforts are ongoing to improve completeness.

# COVID-19 TESTING SUMMARY

SOUTH AFRICA | WEEK 4 2021

## Limitations

- A backlog in testing of samples by laboratories affects the reported numbers of tests performed. As a result, numbers tested during this period may change in subsequent reports.
- If higher-priority specimens were tested preferentially, this would likely result in an inflated proportion testing positive.
- Different and changing testing strategies (targeted vs. mass testing and PCR vs. antigen-based tests) used by different provinces makes percentage testing positive difficult to interpret and compare.
- Health district and sub-district level were mapped based on the testing facility and not place of residence.
- Patient admission status was categorised based on the reported patient facility and may not reflect whether the patient was actually admitted to hospital.
- Antigen tests may be underestimated as they are used in a number of different settings and results may not be reported.

## CONCLUSIONS

Weekly testing volumes were highest in the first wave of infections in week 28 of 2020 (n=307,900), and in the second wave of infections in week 1 of 2021 (n=492,346). The number of tests performed in week 4 of 2021 (n=230,376) was lower than the previous few weeks. Gauteng (32.0%) performed the largest number of tests in week 4 of 2021, followed by KwaZulu-Natal (25.7%) and Western Cape (13.7%) provinces. KwaZulu-Natal (513 per 100,000 persons), Gauteng (476 per 100,000 persons), Northern Cape (467 per 100,000 persons) and Western Cape (452 per 100,000 persons) provinces had the highest testing rates in week 4 of 2021. The percentage of antigen tests of all tests performed has increased since antigen testing was implemented towards the end of October 2020, and accounted for 16.6% of all tests in week 4. The overall laboratory turnaround time for PCR tests in week 4 of 2021 was 2.0 days; 3.2 days in the public sector and <1 day in the private sector.

In the first wave of infections the percentage testing positive peaked at 29.7% in week 29 of 2020, and in the second wave of infections the percentage testing positive peaked at 34.9% in week 53 of 2020. In week 4 of 2021 the percentage testing positive was 14.0%, lower than has been observed in the previous few weeks. The percentage testing positive in week 4 of 2021 was highest in Limpopo (25.6%) and Mpumalanga (20.9%). Percentage testing positive was 10-20% in the Western Cape, Northern Cape, KwaZulu-Natal, North West, Free State and Gauteng, and was <10% in the Eastern Cape in week 4 of 2021. Compared to the previous week, in week 4 the percentage testing positive decreased in all provinces. Districts showing the greatest proportions testing positive in week 4 were concentrated in KwaZulu-Natal (7 districts), the Western Cape and Limpopo (5 districts each).
