

Cumulative invasive pneumococcal disease case numbers reported by the GERMS-SA surveillance programme, 1 January 2012 to 30 April 2023

GERMS-SA surveillance programme

- GERMS-SA is a national, active, laboratory-based surveillance system initiated in 2003.
- Invasive pneumococcal disease (IPD) cases defined as hospitalised individuals with *Streptococcus pneumoniae* detected from normally sterile-site specimens (e.g. cerebrospinal fluid, blood or joint fluid).
- Repeat isolates from the same individual within 21 days were excluded.
- ~190 laboratories each year send reports and isolates.
- Age, sex, date of specimen collection, and source of specimen were captured.
- Pneumococcal isolates were serotyped by Quellung reaction using specific antisera (Statens Serum Institute, Copenhagen, Denmark). Culture-negative/bacterial antigen detection test positive, or isolates that lost viability were confirmed positive using a real-time *lytA* PCR¹ and serotyped using an adaption from the method described by Azzari *et al.*² This molecular assay includes targets for 38 serotypes (42 serotypes prior to 2014) and covers all serotypes included in PCV13. Only samples with an initial *lytA* PCR ct value of ≤ 35 were included. Where ct value was ≤ 35 but no serotype could be identified by including the 38 targets (42 targets prior to 2014), serotype was classified as non-vaccine type. Where *lytA* PCR ct value was ≥ 36 , serotype was classified as unknown and was not included in graphs. Where the PCR target could not distinguish between vaccine and non-vaccine serotype, serotype was classified as unknown and not included in the figures (targets: 18ABC, 18ABCF, 7AF, 9ALVN and 9AV).
- **Cumulative graph case numbers include viable isolates and those non-viable but characterised using molecular diagnostic techniques.**
- Figures 1 – 3 are for cases < 5 years, and Figures 4 – 6 for cases 5 years and older. Cases with unknown age were excluded from the figures.
- There are three graphs for each age group:
 - Disease caused by any of the seven serotypes in PCV7 (4, 6B, 9V, 14, 18C, 19F and 23F)
 - Disease caused by any of the six additional serotypes in PCV13 but not in PCV7 (1, 3, 5, 6A, 7F, 19A)
 - Disease caused by any serotypes not in PCV13
- Figures showing number of viable isolates submitted to GERMS-SA from 2008 to 2012 can be found in the appendix at the end of this report.
- More information on the GERMS-SA system available at:
<https://www.nicd.ac.za/centres/division-of-public-health-surveillance-and-response/>

PCV vaccine introduction in South Africa

- The 7-valent pneumococcal conjugate vaccine (PCV7) was introduced into the South African Expanded Programme on Immunisation in April 2009, with no catch-up vaccination campaign.
- There was a graded replacement of PCV7 by 13-valent pneumococcal conjugate vaccine (PCV13) in 2011. By June 2011 all provinces were using PCV13.

- There was a limited PCV13 catch-up campaign in 2011 and 2012.
- WHO/UNICEF vaccine coverage estimates for receiving a third dose of the PCV vaccine in South Africa are 10% in 2009, 58% in 2010, 62% in 2011, 75% in 2012, 77% in 2013, 85% in 2014, 85% 2015, 82% in 2016, 78% in 2017, 83% in 2018, 86% in 2019, 83% in 2020, and 87% in 2021.³
- The effect of the vaccine on IPD in South Africa has been described.^{4,5}

Figure 1. Cumulative weekly number of disease episodes of invasive pneumococcal disease due to any of the seven serotypes (4, 6B, 9V, 14, 18C, 19F and 23F) in PCV7: children <5 years of age in South Africa, from 2012 to date. Viable isolates and those serotyped using molecular techniques included.

Figure 2. Cumulative weekly number of disease episodes of invasive pneumococcal disease due to any of the six additional (1, 3, 5, 6A, 7F, 19A) serotypes in PCV13 but not in PCV7: children <5 years of age in South Africa, from 2012 to date. Viable isolates and those serotyped using molecular techniques included. (Note: There is reported cross protection between 6A and 6B which is included in PCV7⁶)

Figure 3. Cumulative weekly number of disease episodes of invasive pneumococcal disease due to any of the serotypes not in PCV13: children <5 years of age in South Africa, from 2012 to date. Viable isolates and those serotyped using molecular techniques included.

Figure 4. Cumulative weekly number of disease episodes of invasive pneumococcal disease due to any of the seven serotypes (4, 6B, 9V, 14, 18C, 19F and 23F) in PCV7: individuals ≥ 5 years of age in South Africa, from 2012 to date. Viable isolates and those serotyped using molecular techniques included.

Figure 5: Cumulative weekly number of disease episodes of invasive pneumococcal disease due to any of the six additional (1, 3, 5, 6A, 7F, 19A) serotypes in PCV13 but not in PCV7: individuals ≥ 5 years of age in South Africa, from 2012 to date. Viable isolates and those serotyped using molecular techniques included (Note: There is reported cross protection between 6A and 6B which is included in PCV7⁶)

Data are provisional as reported to date.

Figure 6. Cumulative weekly number of disease episodes of invasive pneumococcal disease due to any of the serotypes not in PCV13: individuals ≥ 5 years of age in South Africa, from 2012 to date. Viable isolates and those serotyped using molecular techniques included.

Figure 7. Number of disease episodes of invasive pneumococcal disease due to serotypes included in PCV13: individuals <5 years of age in South Africa, from January 2012 to April 2023. Viable isolates and those serotyped using molecular techniques included.

Figure 8. Number of disease episodes of invasive pneumococcal disease due to serotypes included in PCV13: individuals ≥5 years of age in South Africa, from January 2012 to April 2023. Viable isolates and those serotyped using molecular techniques included.

Missing information

Age was unknown for 1,162 of the cases (Table 1). By the time that this report was produced there were 4 viable isolates with pending serotype results (Table 2). For 556 isolates in the reporting period, serotype could not be identified due to high C_t value during *lytA* PCR, or PCR serotype target not distinguishing between vaccine and non-vaccine serotype.

Table 1. Isolates with missing age; number of viable, non-viable isolates and audit cases identified, January 2012 to date.

	Age missing, n(%)	Viable, n(%)	Non-viable, n(%)	Audit/missing isolates, n(%)	Capture delays*, n(%)	Total
2012	248 (8)	2,160 (67)	273 (8)	789 (24)	0 (0)	3,222
2013	138 (5)	1,932 (67)	268 (9)	665 (23)	0 (0)	2,865
2014	165 (6)	1,752 (64)	291 (11)	688 (25)	0 (0)	2,731
2015	157 (6)	1,700 (65)	208 (8)	727 (28)	0 (0)	2,635
2016	41 (2)	1,578 (65)	197 (8)	658 (27)	0 (0)	2,433
2017	34 (1)	1,535 (63)	280 (11)	625 (26)	0 (0)	2,440
2018	42 (2)	1,336 (58)	327 (14)	650 (28)	0 (0)	2,313
2019	38 (2)	1,385 (59)	345 (15)	621 (26)	0 (0)	2,351
2020	30 (2)	790 (64)	183 (15)	269 (22)	0 (0)	1,242
2021	96 (6)	982 (63)	244 (16)	323 (21)	0 (0)	1,549
2022	139 (8)	1,201 (65)	210 (11)	434 (24)	1 (0)	1,846
2023	34 (8)	282 (64)	23 (5)	88 (20)	51 (11)	444
Total	1,162 (4)	16,633 (64)	2,849 (11)	6,537 (25)	52 (0)	26,071

*Cases reported to CRDM, but viability is unknown due to capturing delays.

Table 2. Cases where serotype was not available at the time this report was produced

	Not typed	Unknown serotype	Viable, serotype pending	Non-viable, serotype pending	Viability unknown*, serotype pending	Total serotypes pending
2012	38	9	0	0	0	0
2013	36	15	0	0	0	0
2014	0	38	0	0	0	0
2015	0	36	0	0	0	0
2016	2	28	0	0	0	0
2017	3	42	0	0	0	0
2018	0	28	0	0	0	0
2019	0	62	0	0	0	0
2020	0	58	0	0	0	0
2021	0	114	0	0	0	0
2022	0	106	0	0	1	1
2023	0	20	0	0	51	51
Total	79	556	0	0	52	52

* Viability unknown due to capturing delays

Discussion

Serotypes 3, 19F and 19A continue to be the most detected vaccine serotypes among young children <5 years of age (Figure 7) and serotypes 3, 4 and 19F among individuals aged ≥5 years (Figure 8). We have not observed significant increases in specific serotype disease in either age group. Although IPD episode numbers reduced during 2020 and 2021 due to the coronavirus disease 2019 (COVID-19) pandemic, IPD episode numbers started returning to pre-pandemic levels since 2022. GERMS-SA is continuing to collaborate with laboratories to encourage the submission of specimens to improve the monitoring of trends.
