**Division of the National Health Laboratory Service** 

### Weekly respiratory pathogens report Week 26 of 2023

### <u>Highlights</u>

- The 2023 influenza season started in week 17 (week starting 24 April 2023) when the influenza detection rate (3-week moving average) breached the seasonal threshold and peaked in week 22 (week starting on 4 June 2023). Influenza transmission is currently below seasonal threshold, while impact is at the low level and circulation continues to decline.
- In 2023 to date, 917 influenza cases have been detected from all surveillance programmes, of which 98% (819/842) of those with typing information available were influenza A(H3N2). The majority of cases were reported from Western Cape (n=311), followed by Gauteng (n=249), North West (n=127), KwaZulu-Natal (n=94), Mpumalanga (n=94), Eastern Cape (n=38), Limpopo (n=2) and Free State (n=2) sentinel surveillance sites.
- In 2023 to date, 711 respiratory syncytial virus (RSV) cases have been detected from all surveillance programmes. The RSV season ended in week 21 (week starting 22 May 2023), although circulation of RSV continues.
- In 2023 to date, 135 cases of *Bordetella pertussis* were detected, of which 26% (35/135) were from Gauteng Province, 21% (29/135) North West Province, 17% (23/135) from Mpumalanga Province 16% (22/135) Western Cape Province, 15% (20/135) from KwaZulu-Natal Province and 4% (6/135) from Eastern Cape Province.
- In 2023 to date, 254 COVID-19 cases were detected from all surveillance programmes. Of the 226 specimens sequenced, a variant could be assigned in 62.4% (141/226). Of these, 98% (138/141) were assigned the Omicron variant, of which 60% (82/138) were Omicron (23A/XBB.1.5), 12% (17/138) each were Omicron (22E/BQ.1.1) and Omicron (22B/BA.5), 10% (14/138) Omicron (22F/BA.2.10.1), 3% (4/138) Omicron (23B/XBB.1.16), and 2% (2/138) each Omicron (21K/BA.1) and Omicron (22D/BM.1.1). One (0.4%, 1/226) was assigned XAY, XBF and XBL each respectively, while for the remaining 38% (85/226), a variant could not be assigned due to a low viral load or insufficient sample.

### **Programme Descriptions**

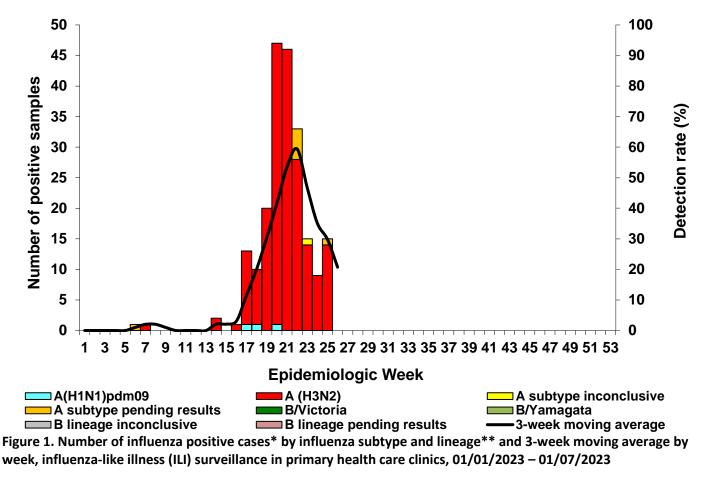

Influenza-like illness (ILI)	Viral Watch	National Syndromic Surveillance for Pneumonia
2012	1984	2009
KZ	EC	EC
NW	FS	GP
WC	GP	KZ
MP	LP	MP
	 MP	NW
	NC	WC
Primary health care clinics	General practitioners	Public hospitals
	ILI: An acute respiratory illness with a	SRI: Acute (symptom onset≤10 days) or
		chronic (symptom onset >10) lower
≤10 days	≤10 days	respiratory tract illness
Suspected pertussis		Suspected pertussis
Any person with an acute cough illness		Any person with an acute cough illness
lasting ≥14 days (or cough illness of any		lasting ≥14 days (or cough illness of any
duration for children <1 year), without a		duration for children <1 year), without a
more likely diagnosis AND one or more of		more likely diagnosis AND one or more of
the following signs or symptoms:		the following signs or symptoms:
<ul> <li>paroxysms of coughing,</li> </ul>		<ul> <li>paroxysms of coughing,</li> </ul>
		<ul> <li>or inspiratory "whoop",</li> </ul>
		<ul> <li>or post-tussive vomiting</li> </ul>
		<ul> <li>or apnoea in children &lt;1 year;</li> </ul>
OR		OR
Any person in whom a clinician suspects pertussis		Any person in whom a clinician suspects pertussis.
Suspected SARS-CoV-2	Surgested CARS CoV 2	Suspected SARS-CoV-2
	•	Any person admitted with a physician-
		diagnosis of suspected COVID-19 and
		not meeting SRI case definition.
		not meeting shi case demitton.

**Epidemic Threshold** 

Thresholds are calculated using the Moving Epidemic Method (MEM), a sequential analysis using the R Language, available from: http://CRAN.R-project.org/web/package=mem) designed to calculate the duration, start and end of the annual influenza epidemic. MEM uses the 40th, 90th and 97.5th percentiles established from available years of historical data to calculate thresholds of activity. Thresholds of activity for influenza and RSV are defined as follows: Below seasonal threshold, Low activity, Moderate activity, High activity. Very high activity. For influenza, thresholds from outpatient influenza like illness (ILI in primary health care clinics) are used as an indicator of disease transmission in the community and thresholds from pneumonia surveillance are used as an indicator of impact of disease. For RSV, thresholds from pneumonia surveillance, using data from children aged < 5 years are used to define the start and end of the season.

\* EC: Eastern Cape; FS: Free State; GP: Gauteng; KZ: KwaZulu-Natal; LP: Limpopo; MP: Mpumalanga: NC: Northern Cape; NW: North West; WC: Western Cape \*\*Symptoms include ANV of the following respiratory symptoms: cough, sore throat, shortness of breath, anosmia (loss of sense of smell) or dysgeusia (alteration of the sense of taste), with or without other symptoms (which may include fever, weakness, myalgia, or diarrhoea). Testing for SARS-CoV-2 was initiated in all three surveillance programmes in week 10 of 2020 (week starting 2 March 2020).\*\*\*INF: influenza virus; RSV: respiratory syncytial virus; BP: Bordetella pertusis; SARS-CoV-2: severe acute respiratory syndrome coronavirus 2

### Page **19** of **20**

### **Methods**

### SARS-CoV-2 Testing

March 2020 – March 2021: SARS-CoV-2 was detected using the Roche E gene real-time PCR assay (Corman et al. *Euro Surveillance* 2020) with cycle threshold ( $C_t$ ) <40 interpreted as positive for SARS-CoV-2. From April 2021 to date the laboratory changed to the Allplex<sup>TM</sup> SARS-CoV-2/FluA/FluB/RSV kit (Seegene Inc., Seoul, South Korea), with positivity assigned if the PCR cycle threshold ( $C_t$ ) was <40 for ≥1 gene targets (N, S or RdRp).

A confirmed SARS-CoV-2 case is a person of any age enrolled in surveillance with laboratory confirmation of SARS-CoV-2 infection by PCR. Only positive SARS-CoV-2 specimens on PCR are further tested to determine variant/lineage type by variant PCR or genomic sequencing. Variant PCR

Allplex<sup>TM</sup> SARS-CoV-2 Variants I PCR detects Alpha and Beta/Gamma variants. The assay was conducted on all SARS-CoV-2-positive samples from 1 March 2020 – 30 June 2021.

Allplex<sup>TM</sup> SARS-CoV-2 Variants II PCR detects Delta variant and distinguishes Beta from Gamma. The assay was conducted on SARS-CoV-2-positive samples from 1 Jan to 30 June 2021.

Extraction: Total nucleic acids were extracted from 200µl NP/OP samples in universal or viral transport medium using a MagNA Pure 96 automated extractor and DNA/Viral NA Small Volume v2.0 extraction kit (Roche Diagnostics, Mannheim, Germany).

### SARS-CoV-2 genomic surveillance

#### SARS-CoV-2 Whole-Genome Sequencing and Genome Assembly

#### **RNA Extraction**

RNA was extracted either manually or automatically in batches, using the QIAamp viral RNA mini kit (QIAGEN, CA, USA) or the Chemagic 360 using the CMG-1049 kit (PerkinElmer, MA, USA). A modification was done on the manual extractions by adding 280 µl per sample, in order to increase yields. 300 µl of each sample was used for automated magnetic bead-based extraction using the Chemagic 360. RNA was eluted in 60 µl of the elution buffer. Isolated RNA was stored at -80 °C prior to use.

#### PCR and Library Preparation

Sequencing was performed using the Illumina COVIDSeq protocol (Illumina Inc., CA, USA) or nCoV-2019 ARTIC network sequencing protocol v3 (https://artic.network/ncov-2019). These are amplicon-based next-generation sequencing approaches. Briefly, for the nCoV-2019 ARTIC network sequencing protocol, the first strand synthesis was carried out on extracted RNA samples using random hexamer primers from the SuperScript IV reverse transcriptase synthesis kit (Life Technologies, CA, USA) or LunaScript RT SuperMix Kit (New England Biolabs (NEB), MA, USA). The synthesized cDNA was amplified using multiplex polymerase chain reactions (PCRs) using ARTIC nCoV-2019 v3 primers. For the COVIDSeq protocol, the first strand synthesis was carried out using random hexamer primers from Illumina and the synthesized cDNA underwent two separate multiplex PCR reactions.

For Illumina sequencing using the nCoV-2019 ARTIC network sequencing protocol, the pooled PCR products underwent bead-based tagmentation using the Nextera Flex DNA library preparation kit (Illumina Inc., CA, USA). The adapter-tagged amplicons were cleaned up using AmpureXP purification beads (Beckman Coulter, High Wycombe, UK) and amplified using one round of PCR. The PCRs were indexed using the Nextera CD indexes (Illumina Inc., CA, USA) according to the manufacturer's instructions. For COVIDSeq sequencing protocol, pooled PCR amplified products were processed for tagmentation and adapter ligation using IDT for Illumina Nextera UD Indexes. Further enrichment and clean-up was performed as per protocols provided by the manufacturer (Illumina Inc., CA, USA). Pooled samples from both COVIDSeq protocol and nCoV-2019 ARTIC network protocol were quantified using Qubit 3.0 or 4.0 fluorometer (Invitrogen Inc., MA, USA) using the Qubit dsDNA High Sensitivity assay according to manufacturer's instructions. The fragment sizes were analyzed using TapeStation 4200 (Invitrogen Inc., MA, USA). The pooled libraries were further normalized to 4nM concentration and 25 µl of each normalized pool containing unique index adapter sets were combined in a new tube. The final library pool was denatured and neutralized with 0.2 N sodium hydroxide and 200 mM Tris-HCL (pH7), respectively. 1.5 pM sample library was spiked with 2% PhiX. Libraries were loaded onto a 300-cycle NextSeq 500/550 HighOutput Kit v2 and run on the Illumina NextSeq 550 instrument (Illumina Inc., CA, USA).

#### Assembly, Processing and Quality Control of Genomic Sequences

Raw reads from Illumina sequencing were assembled using the Exatype NGS SARS-CoV-2 pipeline v1.6.1, (<u>https://sars-cov-2.exatype.com/</u>). The resulting consensus sequence was further manually polished by considering and correcting indels in homopolymer regions that break the open reading frame (probably sequencing errors) using Aliview v1.27, (<u>http://ormbunkar.se/aliview/</u>) (Larsson, 2014). Mutations resulting in mid-gene stop codons and frameshifts were reverted to wild type. All assemblies determined to have acceptable quality (defined as having at least 1 000 000 reads and at least 40 % 10 X coverage) were deposited on GISAID (<u>https://www.gisaid.org/</u>) (Elbe & Buckland-Merrett, 2017; Shu & McCauley, 2017).

#### **Classification of Lineage, Clade and Associated Mutations**

Assembled genomes were assigned lineages using the 'Phylogenetic Assignment of Named Global Outbreak Lineages' (PANGOLIN) software suite (<u>https://github.com/hCoV-2019/pangolin</u>) (Rambaut et al., 2020), a tool used for dynamic SARS-CoV-2 lineage classification. The SARS-CoV-2 genomes in our dataset were also classified using the clade classification proposed by NextStrain (<u>https://nextstrain.org/</u>), a tool built for real-time tracking of the pathogen evolution (Hadfield et al., 2018).
